

## **Clothianidin**

**Anita Pease** to: Mark Corbin, Stephanie Syslo, William Eckel

09/27/2010 05:05 PM

From what I can tell, the most recent risk assessment for a foliar use of clothianidin was completed in September 2005 for grapes and potatoes (at a max rate of 0.2 lbs/A). Later assessments in 2009 and 21010 focused on seed treatment uses (new uses, Section 18s, and EUPs) and foliar uses less than those assessed in 2005. The highest foliar application rate for clothianidin is for turf at 0.4 lbs/A

The bottom line conclusions are risks to the following taxonomic groups: terrestrial invertebrates (particularly pollinators for which there are many incidents), freshwater benthic invertebrates, estuarine/marine invertebrates, and small mammals.

Let me know if there is anything else you need for the meeting w/RD.
